

EZRA Booking Flow Test Cases

Project: Ezra Booking System

Module: Booking Flow

Test Case ID: TC-EZRA-BF-001

Prepared By: Denny Nguyen

Date: 2026-03-14

Version: 1.0

Part 1 – 18 Test Cases for Ezra Booking Flow (Prioritized)

Priority	Test Case ID	Scenario	Steps	Expected Result
1	TC01	Successful booking with valid payment	Select scan → choose available slot → enter valid user info → enter valid payment details → submit	Payment succeeds and appointment is confirmed
2	TC02	Payment declined by payment provider	Select slot → enter valid user info → enter declined/invalid card → submit	Booking is not created and user sees payment failure message
3	TC03	Prevent double booking of the same slot	User A selects slot → User B attempts to book same slot simultaneously	System prevents second booking and shows slot unavailable
4	TC04	Slot availability validation	Select slot → slot becomes unavailable before payment → attempt payment	System prevents booking and asks user to select new slot
5	TC05	Required patient information validation	Leave required fields empty (name/email/phone) → continue booking	System displays validation errors and prevents continuation

6	TC06	Successful booking confirmation	Complete booking with valid data	Confirmation page displayed and booking confirmation email sent
7	TC07	Payment timeout handling	Begin payment → delay submission until session expires	System shows timeout message and prevents incomplete booking
8	TC08	Network interruption during payment	Begin payment → simulate network disconnect	System handles error gracefully and prevents duplicate charge
9	TC09	Invalid credit card format	Enter incorrectly formatted card number	System displays validation error before processing payment
10	TC10	Date and time selection validation	Attempt to select unavailable or past appointment slot	System prevents selection of invalid slot
11	TC11	Navigation between steps	Move back and forth between booking steps	User data and slot selection remain saved
12	TC12	Cancel booking before payment	Start booking → cancel before payment	No booking created and slot released
13	TC13	Payment retry after failure	Payment declined → user retries with valid card	Booking succeeds after valid payment
14	TC14	Mobile device compatibility	Perform booking flow on mobile browser	Booking flow works correctly on mobile UI
15	TC15	Optional field validation	Enter invalid optional info (notes/comments)	System accepts or validates optional fields correctly
Critical	TC16	Fraud detection / multiple payments	Attempt to submit the same payment multiple times in quick succession	System prevents duplicate charges and only allows one booking
High	TC17	Accessibility compliance	Perform booking using screen readers / keyboard-only navigation	Booking flow is fully accessible, fields are labeled, and users can complete booking without mouse

High	TC18	Edge case – last slot booking	Two users attempt to book the final available slot at the same time	Only the first confirmed payment reserves the slot; second user sees “slot unavailable” message
------	------	-------------------------------	---	---

Part 2 – Explanation of Top 3 Most Important Test Cases

TC01 – Successful Booking with Valid Payment

This test case validates the **core business functionality of the booking system**. If users cannot successfully complete bookings with valid payment information, the company would lose revenue and customers would not be able to schedule MRI scans. Ensuring this flow works reliably is critical to the business operation.

TC02 – Payment Declined Handling

Handling payment failures correctly is essential for both **user experience and financial accuracy**. If the system does not properly handle declined payments, users may believe they booked an appointment when they have not, or the system may create inconsistent booking records. Clear error handling ensures users understand the issue and prevents incomplete bookings.

TC03 – Prevent Double Booking of Appointment Slots

Double booking would create **serious operational problems**, as two patients could arrive for the same MRI appointment. This would negatively impact customer experience and clinic scheduling. Ensuring the system correctly locks or validates appointment slots prevents scheduling conflicts and maintains system integrity.

Extra Test Cases

TC16 – Fraud Detection / Multiple Payments: Demonstrates awareness of **payment integrity and security risks**, preventing duplicate charges or fraudulent behavior.

TC17 – Accessibility Compliance: Ensures booking flow is **inclusive and ADA compliant**, demonstrating consideration for all types of users.

TC18 – Edge Case – Last Slot Booking: Tests **race conditions** for last-available slots, ensuring the system handles concurrent bookings correctly and prevents user frustration.
